

- **How is your team doing? Does it work well? Can you improve?**
 - The team is doing well. We have had several meetings in the group discussing the project. We could improve the use of the trello board and put some more effort into communicating better with each other.
- **What user stories did you implement in this sprint?**
 - The user story we primarily focused on this sprint was the logic for optimal water intake. The formula consists of the individual's height and weight somewhat like calculating a person's body mass index.
- **What are your plans for the upcoming sprint?**
 - Make clearer distinction when it comes to division of work. As well as being more mindful of using good programming practices, such as pair programming and code reviews to maintain a high quality codebase and effective use of time.
 - In sprint 1 we focused on researching the optimal level of water intake when it came to different variables. Outside of this we focused on creating a minimum viable product where the console handles the input and gives an output based on a formula. This code will be reused in sprint 2 where we will be creating a simple GUI where the user can input the necessary values.
 - Sprint 2 will require that each member will have to learn on how to create a GUI in Python so that we as a group can start implementing the basic GUI. This will be valuable in later sprints where each member can freely add new GUI components to the different features we have planned.
